Export

XEC Export – large scale XRY exporting made easy

XEC Export is an innovative standalone tool from MSAB, specifically designed for users who need batch export capability.

With Export you can now export multiple XRY files to alternative data formats in one easy to use application. Automating the process of manually exporting a batch of XRY reports, Export allows users to complete the job with a single click by running it as service either on a dedicated server or on your workstation.

+ EXPORT MULTIPLE XRY FILES

+ AUTOMATED PROCESS

+ USE AS BACKGROUND SERVICE

MSAB
When you want to stay ahead

CUSTOMIZE YOUR EXPORT EXPERIENCE

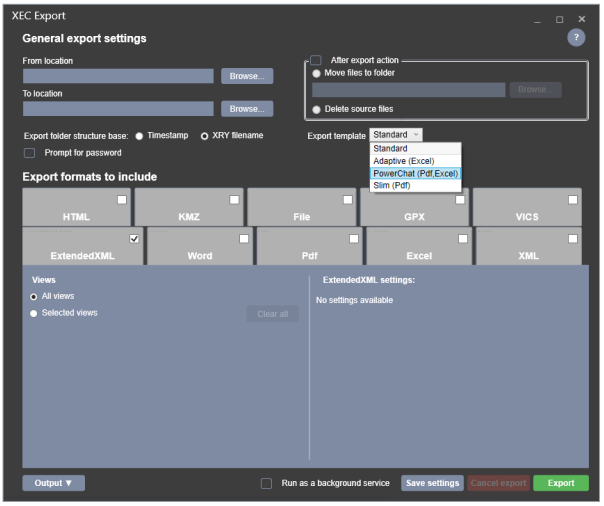
The program gives you the option to export specific or all available views within the XRY file. It then parses the files to determine if the views are available for export before it continues to the next file.

By running Export as a service in the background, you can drop your XRY files into a folder and let the application take care of the process for you. Once finished, you can have Export either move the folder to an archive or have it deleted while all of your exported data is stored in a designated destination. The result is saved within the Event Viewer found in Windows operating system, where you can review the outcome of the exports.

NO MORE WAITING FOR EXPORTING TO FINISH

The benefit of using Export as a background service, is that you do not have to wait for one export to be completed before you can start another batch export. You can add new files into the “incoming” folder and Export will monitor the folder for changes and continue to export the new files as they arrive.

You can configure the program settings to fit your needs. To export manually or use the Export as a service is optional within the same user interface. You can also enable or disable the service from within the user interface at any time.



Export is available in desktop application format.
